

4.3 TRBOnet Watch

HIGHLIGHTED FEATURES

September 2026

Dashboard

The Dashboard has been expanded to support **IP Site Connect (IPSC)**, **Capacity Plus**, and **Linked Capacity Plus** systems.

Monitor radio activity by talk group and site, while the dynamic heatmap provides a visual overview of recent activity changes. The Dashboard also displays essential operational information, including the number of online radios and ongoing calls.

Console Improvements

- ✓ Use the **right-click context menu** to hide, detach, and reattach Watch tabs.
- ✓ Adjust the **width of the left-side panel** across all tabs.
- ✓ **Sound notifications** are now available for Automation Rules.

RSSI Levels: All Data Report

The report now includes a **filter by session type**, allowing you to display specific types of activity, such as text messages and voice calls.

Map

Add **repeaters and other network elements** to the map using their coordinates.

Access Control

TRBOnet Watch now provides more flexible **user access management**.

Each user account can be assigned a **Role**, which defines access to specific application modules, and an **Access Profile**, which specifies the systems and radios available to the user. The same Role and Access Profile can be assigned to multiple user accounts, simplifying administration.

Administrators can also enforce a **custom password policy** for new accounts, including requirements for minimum password length, special characters, digits, and uppercase letters.
